

As a <type of user>	I want <perform some task>	So that <achieve some goal>
Cancer survivor	enter my symptoms, emotions, and habits into a simple survey	I receive a plan that fits my recovery needs
User	my progress to be saved automatically even if I exit midway	I don't lose my progress if I leave the form unfinished
User	the system to explain unclear medical terms in the form	I can complete the form without confusion or hesitation
User	the model to assign me a care plan tag based on my input	I get matched with the most relevant care recommendation
User	download my care plan to share with my doctor	I can use the advice during my medical appointments
User	access extra links and support tools after getting my plan	I can take informed steps beyond the plan itself
Cancer survivor	use the dashboard comfortably without technical knowledge	I feel confident and supported during recovery
Developer	connect the prediction engine to the frontend using Flask API	predictions can be generated and displayed in real-time
Client	see a working demo that runs from survey to care plan output	I can assess how well it supports users in practice

User	get predictions quickly after submitting the survey	I'm not left waiting after form submission
User	receive plain-language explanations for care plan suggestions	I understand why each step in the plan is recommended
User	know that my information is handled securely and privately	I feel safe sharing sensitive information online
Clinician	review and validate the care plans for clinical safety	plans meet safety and ethical healthcare standards
Support group moderator	add community recommendations or peer tips to care plans	users feel more supported by peer-shared experiences
UX researcher	study how users navigate the interface and where they struggle	we can improve usability for future iterations
System admin	update user access rights and manage backend access control	the platform remains secure and well-maintained
Stakeholder	understand how the dashboard could scale with more users	we can plan for long-term system deployment and growth
User	ask the chatbot questions during the survey process	I can get instant clarification without needing external help
Cancer survivor	receive emotional support from the chatbot when I feel overwhelmed	I feel comforted and less isolated during my recovery

First-time user	get a quick introduction from the chatbot on how to use the dashboard	I can start using the platform without confusion
Developer	ensure chatbot responses remain within a safe and helpful scope	users are not misled or confused by unrelated content
UX tester	test how users interact with the chatbot at different stages	I can identify if the chatbot is genuinely improving user experience
Product manager	configure fallback responses when chatbot cannot understand input	users are not left without support when their questions are unclear
Cancer survivor	access articles related to my care plan	I can learn more about managing my symptoms and lifestyle post-treatment
User	filter resources by category (e.g., nutrition, mental health, physical rehab)	I can quickly find information that's most relevant to my current needs
UX researcher	study which resources are most frequently accessed by users	I can understand what content is considered most helpful
Admin	update or remove outdated resource links	users always access accurate, reliable, and up-to-date content
Stakeholder	see analytics on resource engagement	I can evaluate the real-world impact and utility of the educational content
